

<b>Easy HoseGuard® finder</b>		<b>PSI - scfm</b>
1		Determine the operating pressure at the place where the later use of the HoseGuard® is planned.
2		Measure the air consumption of the consumer at operating pressure.
3	 <b>+ 20%</b>	Add a safety allowance of <b>20%</b> to the air consumption of the consumer!
4		Determine the intersection point of the <b>operating pressure</b> and <b>air consumption</b> in the table (see back).
5		The first curve on the right of the <b>intersection point</b> is our HoseGuard®. In our example the green curve = 1/4" High Flow.
6		Install the defined HoseGuard® and test the function of the tool; then perform a function test in accordance with the operating instructions.
<b>Important</b> <ul style="list-style-type: none"> <li>The interior tube cross-sections in front of the HoseGuard® must be larger than or equal to the interior diameter of the HoseGuard®. (The HoseGuard® nominal widths are for 1/4" = 6 mm, 3/8" = 10 mm, 1/2" = 12 mm, 3/4" = 19 mm, 1" = 25 mm).</li> <li>The following figures must be observed as the minimum interior hose diameter: 1/4" = 6 mm, 3/8" = 10 mm, 1/2" = 13 mm, 3/4" = 16 mm / 1" = 19 mm.</li> <li>Extremely long hoses may cause a high pressure drop at the end of the hose. This must be accounted for during planning. Please consider that we need sufficient flow to enable the HoseGuard® to close!</li> </ul>
